

MY 6TH GRADE EPIC

BY EVA DWYER

O muse of sixth grade, help me tell of Big Mac's journey, guiding unruly children through a year of bottle rockets, the science fair, and the war for China.

The bottle rockets were the shiniest things, standing on the rocket launcher.

The class expected them to go far and wide, and they pumped them up using all their strength,

But the rockets tumbled and crashed, seeming to yearn for the ground beneath them.

Big Mac, the great leader, secured pennies to them and the children watched as they flew cleaner than ever

Over the field, over the trees, so high they feared they might never come down.

But they did, and as the rockets were picked up without a scratch to be seen, the children rejoiced.

The class was not prepared for the danger of the science fair; they were to explore unanswered, and perhaps unanswerable, questions.

They formulated their experiments and traveled far and wide to gather supplies.

Many took it for granted, but Big Mac pushed them along, helping each and every one, so they could get them done.

The school demanded the projects be shown, and the children showed them like no other, but only two participants could advance to the finals.

Not many survived. Second, third, and fourth could not go, leaving only first and fifth to represent the class.

Both did well, and one placed on the leader board at the terminating competition.

For the Grand Finale, the classroom was at war over who should rule China.

Many battles were fought, many alliances formed, but all in vain.

Everyone had to turn on each other in order to defend from the merciless Hun, who burned their cities and took their honor.

Some had a craving for war, but others refused to fight, building defenses in hopes the Hun would leave them be,

The Hun paid no heed and soon there were just two armies on the battlefield.

They both fought valiantly, but in the end, Zack Nye the Great conquered them all with Big Mac's help.

Ultimately, Big Mac triumphed by teaching the children everything they would need to know for the dangers that lie ahead in many years to come.
